https://www.dropbox.com/s/9pumvpp8mcctgui/hadoop-2.4.0.userlibraries?dl=0

this is what I used for my lab3

the beginning of all the file paths is the same

Project > Properties > Java Build Path

Libraries tab, click Add Library...

Select User Library and hit Next >

Click on User Libraries

and New...

sorry, not New. click Import...

then browse to that hadoop-2.4.0.userlibraries file

after updating the filepaths to point to your libraries

then make sure you've included it in the Libraries tab of your Java Build Path for your project. it should build/run just fine

then I have a git repo in home/datascience/workspace/PageRank

my .gitignore file contains these three lines:

/bin/* /build/* .classpath

ignoring the .classpath might not be the best idea (because then everyone has to go through this step of adding the libraries manually), but it worked for me

but this way, the git repo looks nice and it's easy for everyone to make changes, push, and pull
